

# Chapter 1

## Fake chapter

### 1.1 Linear Models

#### 1.1.1 Tables, Graphs and Equations

The first step in creating a model is to describe relationships between variables. In  $\langle\langle$ Unresolved xref, reference "investigation-commission"; check spelling or use "provisional" attribute $\rangle\rangle$ , we analyzed the relationship between Delbert's sales and his income. Starting from the verbal description of his income, we represented the relationship by a table of values, a graph, and an algebraic equation. Each of these mathematical tools is useful in a different way.

1. A **table of values** displays specific data points with precise numerical values.
2. A **graph** is a visual display of the data. It is easier to spot trends and describe the overall behavior of the variables from a graph.
3. An **algebraic equation** is a compact summary of the model. It can be used to analyze the model and to make predictions

We begin our study of modeling with some examples of **linear models**. In the examples that follow, observe the interplay among the three modeling tools, and how each contributes to the model.

**Example 1.1.** Annelise is on vacation at a seaside resort. She can rent a bicycle from her hotel for \$3 an hour, plus a \$5 insurance fee. (A fraction of an hour is charged as the same fraction of \$3.)

- a Make a table of values showing the cost,  $C$ , of renting a bike for various lengths of time,  $t$ .
- b Plot the points on a graph. Draw a curve through the data points.
- c Write an equation for  $C$  in terms of  $t$ .

**Solution.**

- a To find the cost, multiply the time by \$3, and add the result to the \$5 insurance fee. For example, the cost of a 1-hour bike ride is

$$\begin{aligned}\text{Cost} &= (\$5 \text{ insurance fee}) + (\$3 \text{ per hour}) \times (1 \text{ hour}) \\ C &= 5 + 3(1) = 8\end{aligned}$$

A 1-hour bike ride costs \$8. Record the results in a table, as shown here:

Length of rental (hours)	Cost of rental (dollars)		$(t, C)$
1	8	$C = 5 + 3(\mathbf{1})$	$(1, 8)$
2	11	$C = 5 + 3(\mathbf{2})$	$(2, 11)$
3	14	$C = 5 + 3(\mathbf{3})$	$(3, 14)$

- b Each pair of values represents a point on the graph. The first value gives the horizontal coordinate of the point, and the second value gives the vertical coordinate. The points lie on a straight line, as shown in the figure. The line extends infinitely in only one direction, because negative values of  $t$  do not make sense here.

- c To find an equation, let  $C$  represent the cost of the rental, and use  $t$  for the number of hours:

$$\begin{aligned}\text{Cost} &= (\$5 \text{ insurance fee}) + (\$3 \text{ per hour}) \times (\text{number of hours}) \\ C &= 5 + 3 \cdot t = 8\end{aligned}$$

**Example 1.2.** Use the equation  $C = 5 + 3 \cdot t$  you found in [Example 1.1](#) to answer the following questions. Then show how to find the answers by using the graph.

- How much will it cost Annelise to rent a bicycle for 6 hours?
- How long can Annelise bicycle for \$18.50?

**Solution.**

- a Substitute  $t = 6$  into the expression for  $C$  to find

$$C = 5 + 3(6) = 23$$

A 6-hour bike ride will cost \$23. The point  $P$  on the graph in the figure represents the cost of a 6-hour bike ride. The value on the  $C$ -axis at the same height as point  $P$  is 23, so a 6-hour bike ride costs \$23.

- b Substitute  $C = 18.50$  into the equation and solve for  $t$ .

$$18.50 = 5 + 3t$$

$$13.50 = 3t$$

$$t = 4.5$$

For \$18.50 Annelise can bicycle for  $4\frac{1}{2}$  hours. The point  $Q$  on the graph represents an \$18.50 bike ride. The value on the  $t$ -axis below point  $Q$  is 4.5, so \$18.50 will buy a 4.5 hour bike ride.

In [Example 1.2](#), notice the different algebraic techniques we used in parts (a) and (b). In part (a), we were given a value of  $t$  and we **evaluated the expression**  $5 + 3t$  to find  $C$ . In part (b) we were given a value of  $C$  and we **solved the equation**  $C = 5 + 3t$  to find  $t$ .

**Exercise 1.3.** Frank plants a dozen corn seedlings, each 6 inches tall. With plenty of water and sunlight they will grow approximately 2 inches per day. Complete the table of values for the height,  $h$ , of the seedlings after  $t$  days.

$t$	0	5	10	15	20
$h$					

- Write an equation for the height of the seedlings in terms of the number of days since they were planted.
- Graph the equation.

**Exercise 1.4.** Use your equation from [Exercise 1.3](#) to answer the questions. Illustrate each answer on the graph.

- How tall is the corn after 3 weeks?
- How long will it be before the corn is 6 feet tall?

For part (b), convert feet to inches.

### 1.1.2 Choosing Scales for the Axes

To draw a useful graph, we must choose appropriate scales for the axes. They must extend far enough to show the values of the variables, and the tick marks should be equally spaced. Usually no more than 10 or 15 tick marks are needed.

**Example 1.5.** In 1990, the median home price in the US was \$92,000. The median price increased by about \$4700 per year over the next decade.

- Make a table of values showing the median price of a house in 1990, 1994, 1998, and 2000.
- Choose suitable scales for the axes and plot the values you found in part (a) on a graph. Use  $t$ , the number of years since 1990, on the horizontal axis and the price of the house,  $P$ , on the vertical axis. Draw a curve through the points.
- Write an equation that expresses  $P$  in terms of  $t$ .
- How much did the price of the house increase from 1990 to 1996? Illustrate the increase on your graph.

**Solution.**

- a In 1990 the median price was \$92,000. Four years later, in 1994, the price had increased by  $4(4700) = 18,800$  dollars, so

$$P = 92,000 + 4(4700) = 110,800$$

In 1998 the price had increased by  $8(4700) = 37,600$  dollars, so

$$P = 92,000 + 8(4700) = 129,600$$

You can verify the price of the house in 2000 by a similar calculation.

Year	Price of House)	$(t, P)$
1990	92,000	$(0, 92,000)$
1994	110,800	$(4, 110,800)$
1998	129,600	$(8, 129,600)$
2000	139,000	$(10, 139,000)$

- b Let  $t$  stand for the number of years since 1990, so that  $t = 0$  in 1990,  $t = 4$  in 1994, and so on. To choose scales for the axes, look at the values in the table. For this graph we scale the horizontal axis, or  $t$ -axis, in 1-year intervals and the vertical axis, or  $P$ -axis, for \$90,000 to \$140,000 in intervals of \$5,000. The points in Figure 1. lie on a straight line.
- c Look back at the calculations in part (a). The price of the house started at \$92,000 in 1990 and increased by  $t \times 4700$  dollars after  $t$  years. Thus,

$$P = 92,000 + 4700t$$

- d Find the points on the graph corresponding to 1990 and 1996. These points lie above  $t = 0$  and  $t = 6$  on the  $t$ -axis. Now find the values on the  $P$ -axis corresponding to the two points. The values are  $P = 92,000$  in 1990 and  $P = 120,200$  in 1996. The increase in price is the difference of the two  $P$ -values.

$$\begin{aligned} \text{increase in price} &= 120,200 - 92,000 \\ &= 28,200 \end{aligned}$$

The price of the home increased \$28,200 between 1990 and 1996. This increase is indicated by the arrows in [Figure 1.6](#) [ref].

Figure 1.6

The graphs in the preceding examples are **increasing graphs**. As we move along the graph from left to right (in the direction of increasing  $t$ ), the second coordinate increases as well. Try [Exercise 1.7](#), which illustrates a **decreasing graph**.

**Exercise 1.7.** Silver Lake has been polluted by industrial waste products. The concentration of toxic chemicals in the water is currently 285 parts per million (ppm). Local environmental officials would like to reduce the concentration by 15 ppm each year

- a Complete the table of values showing the desired concentration,  $C$ , of toxic chemicals  $t$  years from now. For each  $t$ -value, calculate the corresponding value for  $C$ . Write your answers as ordered pairs.

$t$	$C$		$(t, C)$
0		$C = 285 - 150(\mathbf{0})$	$(0, \quad)$
5		$C = 285 - 150(\mathbf{5})$	$(5, \quad)$
10		$C = 285 - 150(\mathbf{10})$	$(10, \quad)$
15		$C = 285 - 150(\mathbf{15})$	$(15, \quad)$

- b To choose scales for the axes, notice that the value of  $C$  starts at 285 and decreases from there. We'll scale the vertical axis up to 300, and use 10 tick marks at intervals of 30. Graph the ordered pairs on the grid, and connect them with a straight line. Extend the graph until it reaches the horizontal axis, but no farther. Points with negative  $C$ -coordinates have no meaning for the problem.
- c Write an equation for the concentration,  $C$ , of toxic chemicals  $t$  years

from now.

**Hint.** For part (c): The concentration is initially 8 ppm, and we subtract 15 ppm for each year that passes, or  $15 \times t$ .

**Remark 1.8** (. images/icon-GC.jpg Graphing an Equation] We can use a graphing calculator to graph an equation. On most calculators, we follow three steps.

To Graph an Equation:

1. Press  $\text{Y=}$  and enter the equation you wish to graph.
2. Press **WINDOW** and select a suitable graphing window.
3. Press **GRAPH**

**Example 1.9** (. images/icon-GC.jpg Using a Graphing Calculator] In [Example 1.5](#), we found the equation  $P = 92,000 + 4700t$  for the median price of a house  $t$  years after 1990. Graph this equation on a calculator.

**Solution.** To begin, we press  $\text{Y=}$  and enter

$$Y1 = 92,000 + 4700X$$

For this graph, we'll use the grid in [Example 1.5](#) for our window settings, so we press **WINDOW** and enter

$$\begin{array}{ll} \text{Xmin} = 0 & \text{Xmax} = 10 \\ \text{Ymin} = 90,000 & \text{Ymax} = 140,000 \end{array}$$

Finally, we press **GRAPH**. The calculator's graph is shown in [Figure 1.10](#).

**Figure 1.10**

**Exercise 1.11.**

- Solve the equation  $2y1575 = 45x$  for  $y$  in terms of  $x$ .
- Graph the equation on a graphing calculator. Use the window

$$\begin{array}{lll} \text{Xmin} = -50 & \text{Xmax} = 50 & \text{Xscl} = 5 \\ \text{Ymin} = -500 & \text{Ymax} = 1000 & \text{Yscl} = 100 \end{array}$$

- Sketch the graph on paper. Use the window settings to choose appropriate scales for the axes.

### 1.1.3 Linear Equations

All the models in these examples have equations with a similar form:

$$y = (\text{starting value}) + (\text{rate of change}) \cdot x$$

(We'll talk more about rate of change in [Unresolved xref, reference "slope-and-rate-of-change"; check spelling or use "provisional" attribute](#).) Their graphs were all portions of straight lines. For this reason such equations are called **linear equations**. The order of the terms in the equation does not matter. For example, the equation in Example 1,

$$C = 5 + 3t$$

can be written equivalently as

$$-3t + C = 5$$

and the equation in Example 3,

$$P = 92,000 + 4700t$$

can be written as

$$-4700 + P = 92,000$$

This form of a linear equation,

$$Ax + By = C$$

is called the **general form**.

### General Form for a Linear Equation

The graph of any equation

$$Ax + By = C$$

where  $A$  and  $B$  are not both equal to zero, is a straight line.

**Example 1.12.** The manager at Albert's Appliances has \$3000 to spend on advertising for the next fiscal quarter. A 30-second spot on television costs \$150 per broadcast, and a 30-second radio ad costs \$50.

- The manager decides to buy  $x$  television ads and  $y$  radio ads. Write an equation relating  $x$  and  $y$ .
- Make a table of values showing several choices for  $x$  and  $y$ .
- Plot the points from your table, and graph the equation.

**Solution.**

- Each television ad costs \$150, so ads will cost \$150. Similarly, radio ads will cost \$50. The manager has \$3000 to spend, so the sum of the costs must be \$3000. Thus,

$$150x + 50y = 3000$$

- Choose some values of  $x$ , and solve the equation for the corresponding value of  $y$ . For example, if  $x = 10$  then

$$150(10) + 50y = 3000$$

$$1500 + 50y = 3000$$

$$50y = 1500$$

$$y = 30$$

If the manager buys 10 television ads, she can also buy 30 radio ads. You can verify the other entries in the table.

$x$	8	10	12	14
$y$				

- Plot the points from the table. All the solutions lie on a straight line, as shown in Figure 1.13.

Figure 1.13

**Exercise 1.14.** In central Nebraska, each acre of corn requires 25 acre-inches of water per year, and each acre of winter wheat requires 18 acre-inches of water. (An acre-inch is the amount of water needed to cover one acre of land to a depth of one inch.) A farmer can count on 9000 acre-inches of water for the coming year. (Source: Institute of Agriculture and Natural Resources, University of Nebraska)

- Write an equation relating the number of acres of corn,  $x$ , and the number of acres of wheat,  $y$ , that the farmer can plant.
- Complete the table.

$x$	50	100	150	200
$y$				

### 1.1.4 Intercepts

Figure 1.15

Consider the graph of the equation

$$3x - 4y = 12$$

shown in Figure 1.15. The points where the graph crosses the axes are called the **intercepts** of the graph. The coordinates of these points are easy to find. The  $y$ -coordinate of the  $x$ -intercept is zero, so we set  $y = 0$  in the equation to get

$$\begin{aligned} 3(0) - 4x &= 12 \\ x &= -3 \end{aligned}$$

The  $x$ -intercept is the point  $(-3, 0)$ . Also, the  $x$ -coordinate of the  $y$ -intercept is zero, so we set  $x = 0$  in the equation to get

$$\begin{aligned} 3y - 4(0) &= 12 \\ y &= 4 \end{aligned}$$

The  $y$ -intercept is  $(0, 4)$ .

#### Intercepts of a Graph

The points where a graph crosses the axes are called the **intercepts of the graph**.

1. To find the  $y$ -intercept, set  $x = 0$  and solve for  $y$ .
2. To find the  $x$ -intercept, set  $y = 0$  and solve for  $x$ .

The intercepts of a graph tell us something about the situation it models.

#### Example 1.16.

- a Find the intercepts of the graph in Exercise 1.7, about the pollution in Silver Lake.
- b What do the intercepts tell us about the problem?

#### Solution.

- a An equation for the concentration of toxic chemicals is

$$C = 285 - 15t$$

To find the  $C$ -intercept, set  $t$  equal to zero.

$$C = 285 - 15(0) = 285$$

The  $C$ -intercept is the point  $(0, 285)$ , or simply 285. To find the  $t$ -intercept, set  $C$  equal to zero and solve for  $t$ .

$$0 = 285 - 15t \quad \text{Add } 15t \text{ to both sides.} \quad 15t = 285 \quad \text{Divide both sides by } 15. \quad t = 19$$

The  $t$ -intercept is the point  $(19, 0)$ , or simply 19.

- b The  $C$ -intercept represents the concentration of toxic chemicals in Silver Lake now: When  $t = 0$ ,  $C = 285$ , so the concentration is currently 285 ppm. The  $t$ -intercept represents the number of years it will take for the concentration of toxic chemicals to drop to zero: When  $C = 0$ ,  $t = 19$ , so it will take 19 years for the pollution to be eliminated entirely.

**Exercise 1.17.**

- a Find the intercepts of the graph in [Example 1.12](#), about the advertising budget for Albert's Appliances:  $150x + 50y = 3000$ .
- b What do the intercepts tell us about the problem?

**1.1.5 Intercept Method for Graphing Lines**

Because we really only need two points to graph a linear equation, we might as well find the intercepts first and use them to draw the graph. The values of the intercepts will also help us choose suitable scales for the axes. It is always a good idea to find a third point as a check.

**Example 1.18.**

- a Find the  $x$ - and  $y$ -intercepts of the graph of  $150x + 180y = 9000$ .
- b Use the intercepts to graph the equation. Find a third point as a check.

**Solution.**

- a To find the  $x$ -intercept, set  $y = 0$ .

$$150x - 18(0) = 9000 \quad \text{Simplify.} \quad 150x = 9000 \quad \text{Divide both sides by 150.} \quad x = 60$$

The  $x$ -intercept is the point  $(60, 0)$ . To find the  $y$ -intercept, set  $x = 0$ .

$$150(0) - 18y = 9000 \quad \text{Simplify.} \quad -180y = 9000 \quad \text{Divide both sides by } -180. \quad y = -50$$

The  $y$ -intercept is the point  $(0, 50)$ .

- b Scale both axes in intervals of 10 and then plot the two intercepts,  $(60, 0)$  and  $(0, 50)$ . Draw the line through them, as shown in [Figure 1.19](#). Now find another point and check that it lies on this line. We choose  $x = 20$  and solve for  $y$ .

$$\begin{aligned} 150(20) + 180y &= 9000 \\ 3000 + 180y &= 9000 \\ 180y &= 6000 \\ y &= 33.\bar{3} \end{aligned}$$

Plot the point  $(20, 33\frac{1}{3})$ . Because this point lies on the line, we can be reasonably confident that our graph is correct.

Figure 1.19

**Remark 1.20** (. images/icon-GC.jpg Choosing a Graphing Window] Knowing the intercepts can also help us choose a suitable window on a graphing calculator. We would like the window to be large enough to show the intercepts. For the graph in Figure 1.19, we can enter the equation

$$Y = (9000 - 150X)/180$$

in the window

$$\begin{array}{ll} \text{Xmin} = -20 & \text{Xmax} = 70 \\ \text{Ymin} = -70 & \text{Ymax} = 30 \end{array}$$

#### To Graph a Line Using the Intercept Method:

\*1\* Find the intercepts of the line.

++a To find the  $x$ -intercept, set  $y = 0$  and solve for  $x$ .

++b To find the  $y$ -intercept, set  $x = 0$  and solve for  $y$ .

\*2\* Plot the intercepts.

\*3\* Choose a value for  $x$  and find a third point on the line.

\*4\* Draw a line through the points.

#### Exercise 1.21.

- In Exercise 1.14, you wrote an equation about crops in Nebraska. Find the intercepts of the graph.
- Use the intercepts to help you choose appropriate scales for the axes, and then graph the equation.
- What do the intercepts tell us about the problem?

The examples in this section model simple linear relationships between two variables. Such relationships, in which the value of one variable is determined by the value of the other, are called **functions**. We will study various kinds of functions throughout the course.

### 1.1.6 Section Summary

#### 1.1.6.1 Vocabulary

Look up the definitions of new terms in the Glossary.

- Variable
- Mathematical model
- Increasing graph
- Linear equation
- Solve an equation
- Evaluate an expression
- Intercept
- Decreasing graph

#### 1.1.6.2 CONCEPTS

- 1 We can describe a relationship between variables with a table of values, a graph, or an equation.
- 2 Linear models have equations of the following form:

$$y = (\text{starting value}) + (\text{rate of change}) \cdot x$$

- 3 To make a useful graph, we must choose appropriate scales for the axes.

#### General Form for a Linear Equation

- 4 The graph of any equation

$$Ax + By = C$$

where  $A$  and  $B$  are not both equal to zero, is a straight line.

- 5 The intercepts of a graph are the points where the graph crosses the axes.
- 6 We can use the intercepts to graph a line.

#### To Graph a Line Using the Intercept Method:

- 1 Find the intercepts of the line.
  - ++a To find the  $x$ -intercept, set  $y = 0$  and solve for  $x$ .
  - ++b To find the  $y$ -intercept, set  $x = 0$  and solve for  $y$ .
- 2 Plot the intercepts.
- 3 Choose a value for  $x$  and find a third point on the line.
- 4 Draw a line through the points.

- 7 The intercepts are also useful for interpreting a model.

#### 1.1.6.3 STUDY QUESTIONS

- 1 Name three ways to represent a relationship between two variables.
- 2 If  $C$  is expressed in terms of  $H$ , which variable goes on the horizontal axis?
- 3 Explain the difference between evaluating an expression and solving an equation.

- 4 How many points do you need to graph a linear equation?
- 5 Explain how the words **intercept** and **intersect** are related; explain how they are different.
- 6 Delbert says that the intercepts of the line  $3x + 5y = 30$  are  $(10, 6)$ . What is wrong with his answer?

#### 1.1.6.4 SKILLS

Practice each skill in the [Homework 1.1.7](#) problems listed.

- 1 Make a table of values: 1–4, 7 and 8
- 2 Plot points and draw a graph: 1–4, 7 and 8
- 3 Choose appropriate scales for the axes: 5–12
- 4 Write a linear model of the form  $y = (\text{starting value}) + (\text{rate of change}) \cdot x$ : 1–8
- 5 Write a linear model in general form: 25–28, 33–36
- 6 Evaluate a linear expression, algebraically and graphically: 1–4
- 7 Solve a linear equation, algebraically and graphically: 1–4
- 8 Find the intercepts of a graph: 5 and 6, 13–24, 45–52
- 9 Graph a line by the intercept method: 5 and 6, 13–24
- 10 Interpret the meaning of the intercepts: 5 and 6, 25–28
- 11 Use a graphing calculator to graph a line: 37–52
- 12 Sketch on paper a graph obtained on a calculator: 37–44

#### 1.1.7 Homework

1. The temperature in the desert at 6 a.m., just before sunrise, was  $65^{\circ}\text{F}$ . The temperature rose 5 degrees every hour until it reached its maximum value at about 5 p.m. Complete the table of values for the temperature,  $T$ , at  $h$  hours after 6 a.m.

$h$	0	3	6	9	10
$T$					

\*a\* Write an equation for the temperature,  $T$ , in terms of  $h$ .

\*b\* Graph the equation.

\*c\* How hot is it at noon? Illustrate the answer on your graph.

\*d\* When will the temperature be  $110^\circ\text{F}$ ? Illustrate the answer on your graph.

**Answer.**

$h$	0	3	6	9	10
$T$	65	80	95	110	115

\*a\*  $T = 65 + 5h$

\*b\*

\*c\*  $95^\circ$

\*d\* 3 p.m.

**2.** The taxi out of Dulles Airport charges a traveler with one suitcase an initial fee of \$2.00, plus \$1.50 for each mile traveled. Complete the table of values showing the charge,  $C$ , for a trip of  $n$  miles.

$n$	0	5	10	15	20	25
$C$						

(a) Write an equation for the charge,  $C$ , in terms of the number of miles traveled,  $n$ .

- (b) Graph the equation.
- (c) What is the charge for a trip to Mount Vernon, 40 miles from the airport? Illustrate the answer on your graph.
- (d) If a ride to the National Institutes of Health (NIH) costs \$39.50, how far is it from the airport to the NIH? Illustrate the answer on your graph.

**3.** On October 31, Betty and Paul fill their 250-gallon oil tank for their heater. Beginning in November, they use an average of 15 gallons of oil per week. Complete the table of values for the amount of oil,  $A$ , left in the tank after  $w$  weeks.

$w$	0	4	8	12	16
$A$					

- (a) Write an equation that expresses the amount of oil,  $A$ , in the tank in terms of the number of weeks,  $w$ , since October 31.

- (b) Graph the equation.
- (c) How much did the amount of fuel oil in the tank decrease between the third week and the eighth week? Illustrate this amount on the graph.

- (d) When will the tank contain more than 175 gallons of fuel oil? Illustrate on the graph.

**Answer.**

$w$	0	4	8	12	16
$A$	250	190	130	70	10

- (a)  $A = 250 - 15w$

- (b)  
(c) 75 gallons  
(d) Until the fifth week

**4.** Leon's camper has a 20-gallon gas tank, and he gets 12 miles to the gallon. (That is, he uses  $1/12$  gallon per mile.) Complete the table of values for the amount of gas,  $g$ , left in Leon's tank after driving  $m$  miles.

$m$	0	48	96	144	192
$g$					

- (a) Write an equation that expresses the amount of gas,  $g$ , in Leon's fuel tank in terms of the number of miles,  $m$ , he has driven.

- (b) Graph the equation.  
(c) How much gas will Leon use between 8 a.m., when his odometer reads 96 miles, and 9 a.m., when the odometer reads 144 miles? Illustrate on the graph.

- (d) If Leon has less than 5 gallons of gas left, how many miles has he driven? Illustrate on the graph.

5. Phil and Ernie buy a used photocopier for \$800 and set up a copy service on their campus. For each hour that the copier runs, Phil and Ernie make \$40.

- (a) Write an equation that expresses Phil and Ernie's profit (or loss),  $P$ , in terms of the number of hours,  $t$ , they run the copier.
- (b) Find the intercepts and sketch the graph. (Suggestion: Scale the horizontal axis from 0 to 40 in increments of 5, and scale the vertical axis from 1000 to 400 in increments of 100.)
- (c) What do the intercepts tell us about the profit?

**Answer.**

- (a)  $P = -800 + 40t$

- (b)  $(0, -800), (20, 0)$
- (c) The  $P$ -intercept, 800, is the initial ( $t = 0$ ) value of the profit. Phil and Ernie start out \$800 in debt. The  $t$ -intercept, 20, is the number of hours required for Phil and Ernie to break even.
6. A deep-sea diver is taking some readings at a depth of 400 feet. He begins rising at 20 feet per minute.
- (a) Write an equation that expresses the diver's altitude,  $h$ , in terms of the number of minutes,  $m$ , elapsed. (Consider a depth of 400 feet as an altitude of 400 feet.)
- (b) Find the intercepts and sketch the graph. (Suggestion: Scale the horizontal axis from 0 to 24 in increments of 2, and scale the vertical axis from 500 to 100 in increments of 50.)
- (c) What do the intercepts tell us about the diver's depth?

7. There are many formulas for estimating the annual cost of driving. The Automobile Club estimates that fixed costs for a small car—including insurance, registration, depreciation, and financing—total about \$5000 per year. The operating costs for gasoline, oil, maintenance, tires, and so forth are about 12.5 cents per mile. (Source: Automobile Association of America)

- (a) Write an equation for the annual driving cost,  $C$ , in terms of  $d$ , the number of miles driven.
- (b) Complete the table of values.

Miles Driven
4000
8000
12,000
16,000
20,000
Cost (\$)

- (c) Choose scales for the axes and graph the equation.
- (d) How much does the annual cost of driving increase when the mileage increases from 8000 to 12,000 miles? Illustrate this amount on the graph.
- (e) How much mileage will cause the annual cost to exceed \$7000? Illustrate on the graph.

**Answer.**

- (a)  $C = 5000 + 0.125d$
- (b) Complete the table of values.

Miles Driven
4000
8000
12,000
16,000
20,000
Cost (\$)
5500
6000
6500
7000
7500

**Answer.**

For Problems 13-18,

- (a) Find the intercepts of the graph.  
 (b) Graph the equation by the intercept method.

13.  $x + 2y = 8$

14.  $2xy = 6$

15.  $3x4y = 12$

**Answer.**

\*a\*  $(8, 0), (0, 4)$

**Answer.**

\*a\*  $(4, 0), (0, -3)$

16.  $2x + 6y = 6$

17.  $\frac{x}{9} \frac{y}{4} = 1$

18.  $\frac{x}{5} + \frac{y}{8} = 1$

**Answer.**

\*a\*  $(9, 0), (0, -4)$

For Problems 19-24,

- (a) Find the intercepts of the graph.  
 (b) Use the intercepts to choose scales for the axes, and then graph the equation by the intercept method.

19.  $20x = 30y45,000$

20.  $30x = 45y + 60,000$

**Answer.**

\*a\*  $(2250, 0), (0, 1500)$

21.  $0.4x + 1.2y = 4.8$

**Answer.**

\*a\*  $(12, 0), (0, 4)$

22.  $3.2x + 0.8y = 12.8$

23.  $\frac{2x}{3} + \frac{3y}{11} = 1$

**Answer.**

\*a\*  $\left(\frac{3}{2}, 0\right), \left(0, \frac{11}{3}\right)$

24.  $\frac{8x}{7} - \frac{2y}{7} = 1$

25. The owner of a gas station has \$19,200 to spend on unleaded gas this month. Regular unleaded costs him \$2.40 per gallon, and premium unleaded costs \$3.20 per gallon.

\*a\* How much do  $x$  gallons of regular cost? How much do  $y$  gallons of premium cost?

\*b\* Write an equation in general form that relates the amount of regular unleaded gasoline,  $x$ , the owner can buy and the amount of premium unleaded,  $y$ .

\*c\* Find the intercepts and sketch the graph.

\*d\* What do the intercepts tell us about the amount of gasoline the owner can purchase?

**Answer.**

\*a\*  $\$2.40x, \$3.20y$

\*b\*  $2.40x + 3.20y = 19,200$

\*d\* The  $y$ -intercept, 6000 gallons, is the amount of premium that the gas station owner can buy if he buys no regular. The  $x$ -intercept, 8000 gallons, is the amount of regular he can buy if he buys no premium.

26. Five pounds of body fat is equivalent to 16,000 calories. Carol can burn 600 calories per hour bicycling and 400 calories per hour swimming.

- \*a\* How many calories will Carol burn in  $x$  hours of cycling? How many calories will she burn in  $y$  hours of swimming?
  - \*b\* Write an equation in general form that relates the number of hours,  $x$ , of cycling and the number of hours,  $y$ , of swimming Carol needs to perform in order to lose 5 pounds.
  - \*c\* Find the intercepts and sketch the graph.
  - \*d\* What do the intercepts tell us about Carol's exercise program?
- 27.** Delbert must increase his daily potassium intake by 1800 mg. He decides to eat a combination of figs and bananas, which are both low in sodium. There are 9 mg potassium per gram of fig, and 4 mg potassium per gram of banana.
- \*a\* How much potassium is in  $x$  grams of fig? How much potassium is in  $y$  grams of banana?
  - \*b\* Write an equation in general form that relates the number of grams,  $x$ , of fig and the number of grams,  $y$ , of banana Delbert needs to get 1800 mg of potassium.
  - \*c\* Find the intercepts and sketch the graph.
  - \*d\* What do the intercepts tell us about Delbert's diet?

**Answer.**

- \*a\*  $9x$  mg,  $4y$  mg
- \*b\*  $9x + 4y = 1800$

- \*c\*
  - \*d\* The  $x$ -intercept, 200 grams, tells how much fig Delbert should eat if he has no bananas, and the  $y$ -intercept, 450 grams, tells how much banana he should eat if he has no figs.
- 28.** Leslie plans to invest some money in two CD accounts. The first account pays 3.6% interest per year, and the second account pays 2.8% interest per year. Leslie would like to earn \$500 per year on her investment.
- \*a\* If Leslie invests  $x$  dollars in the first account, how much interest will she earn? How much interest will she earn if she invests  $y$  dollars in the second account?
  - \*b\* Write an equation in general form that relates  $x$  and  $y$  if Leslie earns \$500 interest.
  - \*c\* Find the intercepts and sketch the graph.
  - \*d\* What do the intercepts tell us about Leslie's investments?

- 29.** Find the intercepts of the graph for each equation.

$$*a* \quad \frac{x}{3} + \frac{y}{5} = 1$$

$$*b* \quad 2x4y = 1$$

$$*c* \quad \frac{2x}{5} - \frac{2y}{3} = 1$$

$$*d* \quad \frac{x}{p} + \frac{y}{q} = 1$$

\*e\* Why is the equation  $\frac{x}{a} + \frac{y}{b} = 1$  called the **intercept form** for a line?

**Answer.**

$$*a* \quad (3, 0), (0, 5)$$

$$*b* \quad \left(\frac{1}{2}, 0\right), \left(0, \frac{-1}{4}\right)$$

$$*c* \quad \left(\frac{5}{2}, 0\right), \left(0, \frac{-3}{2}\right)$$

$$*d* \quad (p, 0), (0, q)$$

\*e\* The value of  $a$  is the  $x$ -intercept, and the value of  $b$  is the  $y$ -intercept.

**30.** Write an equation in intercept form (see Problem 29) for the line with the given intercepts. Then write the equation in general form.

$$*a* \quad (6, 0), (0, 2)$$

$$*b* \quad (3, 0), (0, 8)$$

$$*c* \quad \left(\frac{3}{4}, 0\right), \left(0, \frac{-1}{4}\right)$$

$$*d* \quad (v, 0), (0, w)$$

$$*e* \quad \left(\frac{1}{H}, 0\right), \left(0, \frac{1}{T}\right)$$

**31.**

\*a\* Find the  $y$ -intercept of the line  $y = mx + b$ .

\*b\* Find the  $x$ -intercept of the line  $y = mx + b$ .

**Answer.**

$$*a* \quad (0, b)$$

$$*b* \quad \left(\frac{-b}{m}, 0\right), \text{ if } m \neq 0$$

**32.**

\*a\* Find the  $y$ -intercept of the line  $Ax + By = C$ .

\*b\* Find the  $x$ -intercept of the line  $Ax + By = C$ .

Write an equation in general form for each line.

**33.**

$$\textbf{Answer.} \quad 2x + 3y = 2400$$

**35.**

**34.**

**36.**

$$\textbf{Answer.} \quad 3x + 400y = 240$$

For Problems 37–44,

\*a\* Solve each equation for  $y$  in terms of  $x$ . (See the Algebra Skills Refresher <<Unresolved xref, reference "appendix-Linear-Equations-and-Inequalities"; check spelling or use "provisional" attribute>> to review this skill.)

\*b\* Graph the equation on your calculator in the specified window. (See <<Unresolved xref, reference "appendix-b"; check spelling or use "provisional" attribute>> for help with the graphing calculator.)

\*c\* Make a pencil and paper sketch of the graph. Label the scales on your axes, and the coordinates of the intercepts.

**37.**  $2 + y = 6$

$$\begin{array}{ll} \text{Xmin} = -10 & \text{Ymin} = -10 \\ \text{Xmax} = 10 & \text{Ymax} = 10 \\ \text{Xscl} = 1 & \text{Yscl} = 1 \end{array}$$

**38.**  $8y + 3x = 0$

$$\begin{array}{ll} \text{Xmin} = -10 & \text{Ymin} = -10 \\ \text{Xmax} = 10 & \text{Ymax} = 10 \\ \text{Xscl} = 1 & \text{Yscl} = 1 \end{array}$$

**Answer.**

**a.**  $y = 62x$

**39.**  $3x4y = 1200$

$$\begin{array}{ll} \text{Xmin} = -1000 & \text{Ymin} = -1000 \\ \text{Xmax} = 1000 & \text{Ymax} = 1000 \\ \text{Xscl} = 100 & \text{Yscl} = 100 \end{array}$$

**40.**  $x + 2y = 500$

$$\begin{array}{ll} \text{Xmin} = -1000 & \text{Ymin} = -1000 \\ \text{Xmax} = 1000 & \text{Ymax} = 1000 \\ \text{Xscl} = 100 & \text{Yscl} = 100 \end{array}$$

**Answer.**

**a.**  $y = \frac{3}{4}x - 300$

41.  $0.2x + 5y = 0.1$

$$\begin{array}{ll} \text{Xmin} = -1 & \text{Ymin} = -0.1 \\ \text{Xmax} = 1 & \text{Ymax} = 0.1 \\ \text{Xscl} = 0.1 & \text{Yscl} = 0.01 \end{array}$$

42.  $1.2x + 4.2y = 3.6$

$$\begin{array}{ll} \text{Xmin} = -1 & \text{Ymin} = -1 \\ \text{Xmax} = 4 & \text{Ymax} = 1 \\ \text{Xscl} = 0.2 & \text{Yscl} = 0.1 \end{array}$$

**Answer.**

a.  $y = 0.020.04x$

43.  $70x + 3y = y + 420$

$$\begin{array}{ll} \text{Xmin} = 0 & \text{Ymin} = 0 \\ \text{Xmax} = 10 & \text{Ymax} = 250 \\ \text{Xscl} = 1 & \text{Yscl} = 25 \end{array}$$

44.  $40y + 5x = 78020y$

$$\begin{array}{ll} \text{Xmin} = -200 & \text{Ymin} = 0 \\ \text{Xmax} = 0 & \text{Ymax} = 20 \\ \text{Xscl} = 20 & \text{Yscl} = 2 \end{array}$$

**Answer.**

a.  $y = 21035x$

For Problems 45–52,

\*a\* Find the  $x$ - and  $y$ -intercepts.\*b\* Solve the equation for  $y$ .

\*c\* Choose a graphing window in which both intercepts are visible, and graph the equation on your calculator.

45.  $x + 4y = 100$

46.  $2x + 3y = 72$

**Answer.**

\*a\*  $(100, 0), (0, 25)$

\*b\*  $y = 25\frac{1}{4}x$

47.  $25x + 20y = 1$

**Answer.**

\*a\*  $(0.04, 0), (0, 0.05)$

\*b\*  $y = 1.25x + 0.05$

48.  $4x + 75y = 60,000$

49.  $\frac{y}{12} = \frac{x}{60} = 1$

**Answer.**

\*a\*  $(60, 0), (0, 12)$

\*b\*  $y = 12 + \frac{1}{5}x$

50.  $\frac{x}{80} + \frac{y}{400} = 1$

51.  $2x = 3y + 84$

**Answer.**

\*a\*  $(42, 0), (0, 28)$

\*b\*  $y = -\frac{2}{3}x - 28$

52.  $7x = 9113y$
